What went well?
All dar reports we thought of had a rough draft made. While none were approved, we at least had an idea on where to go.
All our members have a good idea of how to do a low level diagram.

What went bad?
We had a bad understanding on the project. Most things we planned ended up being unnecessary. For example, we did not need to make low levels for things such as weight management. This caused a lot of wasted time in designing

What We can improve on.
We now know what to do for low level, logging, and user management. With a clearer idea of the task, we can plan our next sprint to have all our diagrams finished and a code that is at least over the halfway mark.
